We design and build the most innovative, efficient, and sustainable greenhouses in the Midwest. Our systems are for families, individuals, community organizations and farmers looking to take their growing year-round. These greenhouses are scalable and customizable to fit your needs, from 12'x12' to 20'x60', and with dozens of siding color options.

The passive solar design maximizes sunlight for growth and heat, maintaining suitable growing temperatures year-round with little to no external heating.

With a Subterranean Heating and Cooling (SHAC) System, freshCycle Greenhouses cool the greenhouse during the day by storing heat in the ground and access that heat at night to warm the greenhouse. Along with added day and night stability, heat is stored in the ground during the summer and accessed in the winter. A SHAC System is a cost effective and efficient climate control solution for your freshCycle Greenhouse.
